

1 **Abstract of Disclosure**

2 A selective one-way bit-driving apparatus is provided between a handle
3 and a bit. The selective one-way bit-driving apparatus includes a hollow
4 shaft and a bit receiver. The hollow shaft includes a first section for
5 connection with the handle and a second section. The bit receiver
6 includes a first space for receiving the second section of the hollow shaft
7 and a second space for receiving the bit. The hollow shaft drives the bit
8 receiver in selective one of two directions through a selective one-way
9 driver. At least one connector connects the wall of the first space of the
10 bit receiver with the periphery of the second section of the hollow shaft.
